# 1 Warm-up problems

## 1.1 linear algebra results

- formalize correspondence between linear transformations  $V \rightarrow W$  and matrices (where  $V$  and  $W$  are finite dimensional vector spaces over some field).
- e.g. formulate and prove statements about eigenvectors and eigenvalues of a linear endomorphism of a finite dimensional vector space  $V$ .

Probably the ultimate target would be the Cayley-Hamilton theorem.

## 1.2 finite group theory

- prove that a finite  $p$ -group has a non-trivial center (and hence that a finite  $p$ -group is solvable)
- for a finite  $p$ -group  $G$  and a field  $k$  of char  $p > 0$ , prove that for any finite dimensional  $k$ -vector space  $V$  and any homomorphism  $\rho : G \rightarrow GL(V)$  that  $G$  fixes a non-zero vector in  $V$ .

## 1.3 commutative rings

- prove the Gauss Lemma and Eisenstein's criteria Gauss Lemma already has a proof in mathlib and so does Eisenstein's criteria

## 1.4 Graph theory

- mathlib has a proof of Hall's Marriage Theorem
- prove elementary fact: sum of degrees of vertices is twice the number of edges.

## 2 Formalization ideas

### 2.1 Projective spaces and grassmannians

- mathlib has a formalization of projective spaces can we imitate this formalization to the Grassmannian? What results should be proved about it?

Say something about Plücker embedding?

Is there already a formalization of the *exterior powers* of a vector space? Surely...

### 2.2 forms over a finite field

Defined on a finite dimensional vector space  $V$  over a finite field

- reflexive forms
- quadratic forms / symmetric forms (char 2 and  $p > 2$ )
- alternating forms
- Hermitian forms
- Can you give a formal proof of the theorem describing the number of points of a quadric (i.e. the zero set in  $\mathbb{P}(V)$  of a non-degenerate quadratic form  $q$  on the vector space  $V$  over a finite field.

### 2.3 Polar spaces

- such a space is a “point-line geometry”. Formalize the notion of point-line geometry.
- polar spaces arise from reflexive form on a vector space on a finite field.

### 2.4 Fourier transforms for functions on vector spaces over a finite field

### 2.5 Algebraic combinatorics

- formalize proof of some results from book of R. Stanley.  
e.g. Theorem 1.1 which gives a condition for a formal power series  $f \in k[[t]]$  to be a *rational function*. Try to formalize this proof.  
or more generally, all the “tool-results” from the first section of Stanley’s book.

### 2.6 error-correcting codes

- formalize some basic results about codes - see Simeon Ball’s book.

### 2.7 quaternion algebras

- show they are simple
- describe in the form  $(a, b)$  or (in char. 2)  $(a, b]$ .
- give criteria on  $a, b$  for when the algebra is division.
- formalize proof of result from P. Gilles book about quadratic forms & quaternion algebras.
